

Washington State drinking water regulations, WAC 246-290-490, require public water systems to implement a cross connection control program. Cross-connection control programs help protect public health by preventing contamination of the drinking water as it is delivered to water system customers.

As part of our efforts to keep your drinking water safe, we are conducting a cross-connection control hazard survey of residential customers served by our system. The purpose of the survey is to help us determine if any of our residential customers have special plumbing or activities on their premises that could increase the risk of contamination to our water system.
